

WILDLIFE DISEASE WORKSHOP

THE RAPIDLY CHANGING PICTURE OF DISEASE IN WILDLIFE

Parasite and disease agents live within the same changing milieu affecting wildlife and environments around the globe. This workshop will highlight some recent emerging diseases and changes in parasite distribution that directly affect wildlife, wildlife management, and wildlife practitioners in Alberta.

Come and find out about new threats (white-nose syndrome, snake fungal disease, chronic wasting disease) and old friends (winter ticks, tapeworm larvae, viral papillomas) that are or may become part of the biodiversity of the province. An interactive presentation of facts and photos, supplemented with pickled parasites and hands-on materials.

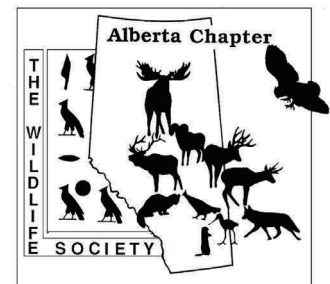

Workshop Presenters:

Drs Margo Pybus and Bill Samuel
